make a statement

CNC routers are multi-directional machines; they can simultaneously move and cut in three different directions to develop quick shapes and patterns. CNC routed products are more accurate and allow us to complete projects in hours that used to take several days.

CNC routers allow us to carve, drill, cut, shave, and perfect almost any project of various materials: wood, plastic, acrylic, rubber, and even aluminum. This allows us to create intricate designs based on your specifications for custom furniture, 3D signs, displays, and unique scenery.
