Vacuform

make a statement

Vacuforming is the process of molding a sheet of plastic (such as styrene, ABS, or acrylic) into a desired shape. A specifically designed vacuform machine first heats the plastic to a pliable level and then pulls the material around a desired mold. Once the plastic is in place around the mold vacuum pumps are engaged, this removes air from between the plastic and mold to create an identical copy.

Vacuform is an inexpensive way to add 3D effects to any set in any venue. This adds dimension and character to an otherwise simply scenic paint finish.

Please visit our website for a gallery of all available molds; custom molds available upon request.
